

GEATAN RD 44

Chemical Nature:	resinous tannin of dicyandiamide base
Active Substance:	approx. 96%
pH (10%):	approx. 7,0
Ionic Charge:	anionic
Aspect:	white powder
Light Fastness:	excellent
Utilization:	retanning agent for filling with selective action

PROPERTIES

GEATAN RD 44 is a retanning agent presenting numerous advantages over other agents as it acts in a selective form close to the leather fibers, preferably where the structure is emptier. This characteristic highly improves the leathers' aspect, making them fuller and with optimal grain firmness. However, due to its chemical composition, GEATAN RD 44 does not change the chrome tanning characteristics, and, for not being astringent, avoids the grain from wrinkling. GEATAN RD 44 enables a uniform and intense dyeing to be obtained, has optimal buffing capacity and maintains the pores closed. Another peculiar characteristic of this product is the improvement of the leathers' physical-mechanical strength, including when they are stored for long periods of time. GEATAN RD 44 is indicated for all types of chrome leathers, such as baby-calf, box, goat, nubuck, swedes, alone or combined with synthetic and vegetable retanning agents. GEATAN RD 44 has optimal light fastness and produces leathers with fine embossing retention. It is also recommended for furniture upholstery, and automotive leathers. It is recommended to be used after neutralization in a new float. It also produces good results when applied together with GEATAN BG, before fatliquoring.
