

GEOTAN PB 54

Chemical Nature:	acrylic polymer
Active Substance:	approx. 35%
pH (10%):	approx. 3,0
Ionic Charge:	anionic
Aspect:	yellowish liquid
Light Fastness:	excellent
Utilization:	all kind of articles

PROPERTIES

GEOTAN PB 54 is a resinous Retanning agent characterized by excellent results of grain tightness and filling. GEOTAN PB 54 reacts notably well with the collagen, that is found in the entire structure of the leather. This chain reaction of acrylate-chrome-fiber occurs even in the regions of less fibers concentration (belly and flanks). GEOTAN PB 54 can be used in all Retanning steps, whether together with chrome salts, before or after neutralization, and for a better fixation of tannins, after Retanning. Whenever used together with chrome, it enables a good exhaustion, producing full leathers with very fine grain and small pores. Due to its chemical composition, it does not change the chrome tanned leathers' softness.
